

### APPENDIX 3

**TABLE 1. COMPARISON OF THE KEY FINDINGS ON EFFICACY OF ESWT IN TREATMENT OF CRCT**

<b>Reference</b>	<b>Intervention</b>	<b>Outcome measures</b>	<b>Results</b>	<b>Conclusions</b>
Albert et al (2007)	Group 1 – high energy ESWT – 2500 impulses 14 days apart, up to 0.45 mJ/mm <sup>2</sup>  Group 2 – low energy ESWT – 2500 impulses 14 days apart, up to 0.06 mJ/mm <sup>2</sup>	<ul style="list-style-type: none"> <li>• Constant &amp; Murley score</li> <li>• Pain relief assessed by VAS score</li> <li>• Resorption of calcific deposits assessed on radiographs</li> </ul>	<ul style="list-style-type: none"> <li>• Improvement in shoulder function in the Group 1</li> <li>• Pain relief was more marked in the Group 1 but did not reach statistical significance</li> <li>• Calcific deposits remained unchanged in size for the majority of patients</li> </ul>	High energy ESWT is effective treatment for chronic calcifying tendonitis of the rotator cuff.
Krasny et al (2005)	Group 1 – ultrasound-guided needling followed by high energy ESWT 2500 impulses with energy flux density of 0.36 mJ/mm <sup>2</sup>  Group 2 – high energy ESWT only	<ul style="list-style-type: none"> <li>• Constant &amp; Murley score</li> <li>• Pain relief assessed by VAS score</li> <li>• Calcific deposits resorption assessed on radiographs</li> </ul>	<ul style="list-style-type: none"> <li>• Overall improvement in the Constant score – 67.5%, unchanged score – 32.5%</li> <li>• Improvement in the Constant score was markedly higher in Group 1</li> <li>• Overall elimination of calcific deposits – 46.3%, partial disintegration – 30.0%, radiologically unchanged – 23.7%</li> <li>• Significantly better disintegration of calcific deposits in Group 1</li> <li>• Subsequent to treatment 32.5% of patients required arthroscopic removal of</li> </ul>	Ultrasound-guided needling in a combination with shock-wave therapy is more effective than shock-wave therapy alone in patients with symptomatic calcific tendonitis.

			calcific deposits	
Pleiner et al (2004)	<p>Group 1 – 31 shoulders were treated at the area of maximum pain with application of 2x2000 impulses of 0.28 mJ/mm<sup>2</sup> at the interval of 2 weeks</p> <p>Group 2 – 26 shoulders were treated with 2x2000 impulses &lt; 0.07 mJ/mm<sup>2</sup> at an interval of 2 weeks</p>	<ul style="list-style-type: none"> <li>• Constant score</li> <li>• Pain relief</li> <li>• Radiological assessment of calcific deposits</li> </ul>	<ul style="list-style-type: none"> <li>• Improvement in the Constant score was significantly higher in Group 1.</li> <li>• Significant improvement in pain in Group 1 at the 1-week follow up, however at the 3-month and 7-month follow up assessments no difference in pain could be detected.</li> <li>• Seven months post-treatment calcific deposits resolved completely in 19% in the Group 1 and 8% in the Group 2</li> </ul>	<p>ESWT with an energy flux density of 0.28 mJ/mm<sup>2</sup> achieved significantly greater improvement in shoulder function and slightly higher but not significant disintegration of calcific deposits. However it did not result in pain relief.</p>
Cosentino et al (2004)	<p>All patients had four treatments (one every 4-7 days), each consisting of 1200 shocks with a frequency 120 shocks per minute. The energy flux density started at 0.03 mJ/mm<sup>2</sup>, gradually increasing to 0.28</p>	<ul style="list-style-type: none"> <li>• Constant and Murley score at baseline, after the treatment, and at 3 and 6 month follow up</li> <li>• Radiological assessment of calcific deposits</li> </ul>	<ul style="list-style-type: none"> <li>• Significant improvement in shoulder function</li> <li>• Significant pain relief</li> <li>• At 1 month after the treatment partial resorption of calcific deposits was observed in 44.5% of patients, complete resorption in 22.3% and no response was recorded in 33.2% of patients</li> </ul>	<p>Good tolerance and safety of the treatment, good clinical-radiological response.</p>

	mJ/mm <sup>2</sup>			
Peters et al (2004)	<p>Group 1 – received weekly shocks with the number of pulses per session 1500, with energy flux density 0.15 mJ/mm<sup>2</sup></p> <p>Group 2 – received weekly treatment with the number of pulses per session 1500 with energy flux density 0.44 mJ/mm<sup>2</sup></p> <p>Group 3 – sham treatment</p>	<ul style="list-style-type: none"> <li>• Pain during ESWT</li> <li>• Haematoma secondary to ESWT</li> <li>• Resorption of calcific deposits</li> <li>• Recurrence of pain</li> </ul>	<ul style="list-style-type: none"> <li>• Pain during ESWT – significantly more intense in the Group 2</li> <li>• Haematoma – 6% in the Group 1; 19% in the Group 2</li> <li>• Residual calcifications at a 6 month follow up – 100% in the Group 1; no calcifications in the Group 2</li> <li>• Recurrence of pain at 6 month – 87% in the Group 1; none in the Group 2</li> </ul>	High-energy ESWT is very effective in treatment of calcific tendonitis of the shoulder.
Sabeti-Aschraf et al (2005)	<p>Group 1 – at weekly intervals received 3 sessions of low-energy shocks, 1000 impulses of 0.08 mJ/mm<sup>2</sup> at the point of maximum tenderness identified by palpation</p>	<ul style="list-style-type: none"> <li>• Constant and Murley score</li> <li>• Pain relief assessed by VAS</li> <li>• Resorption of calcific deposits</li> </ul>	<ul style="list-style-type: none"> <li>• Both groups showed significant improvement in shoulder function and pain relief.</li> <li>• VAS at 12 weeks improved: Group 1 – from 68.36 to 33.36 Group 2 – from 65.96 to 18.21</li> <li>• Constant and Murley score improved at 12 weeks Group 1 – by 17.36 points Group 2 – by 30.08 points</li> <li>• Complications or severe side effects were not recorded</li> </ul>	Three-dimensional, computer-assisted navigation achieved significantly better results than ESWT focused on the point of maximum tenderness as identified by palpation.

	Group 2 - at weekly intervals received 3 sessions of low-energy shocks, 1000 impulses of 0.08 mJ/mm <sup>2</sup> with the shock wave focused on calcium deposits as identified on a 3-dimensional computer-assisted navigation device

**TABLE 2. COMPARISON OF OUTCOME MEASURES FOR CRCT**

<i>Study</i>	<i>Quality of study</i>	<i>Efficacy</i>					
		Pain reduction score (VAS mean % change)		Shoulder function Constant & Murley score (mean group point change >25 points)		Calcific lesion complete resolution (% in each group)	
		Treatment group	Control/sham group	Treatment group	Control/sham group	Treatment group	Control/sham group
Albert et al 2007	1-	?	?	At 3 months No (12.5)	At 3 months No (4.5)	At 3 months in 15%	At 3 months in 5%
Krasny et al 2005	1-	Grp1: at 4 months ? Grp2 at 4 months ?	No control group	Grp1: at 4 months Yes (30.5); Grp2: At 4 months No (23.1)	No control group	Grp1: At 4 months in 60%; Grp2:at 4 months in 32.5%	No control group
Pleiner et al 2004	1-	?	?	At 7 months ?	At 7 months ?	At 7 months in 19%	At 7 months in 8%
Cosentino et al 2004	2+	?	No control group	At 3 months Yes (31.5)	No control group	At 1 month in 22.3%	No control group
Peters et al 2004	1	Grp1: at 6 months ?; Grp2: At 6 months ?	Grp1: At 6 months ?; Grp2: At 6 months ?	Constant and Murley score not assessed	Constant and Murley score not assessed	Grp1: At 6 months in ?%; Grp2:At 6 months in ?%	At 6 months in 0%

Sabeti-Aschraf et al 2005	1-	Grp1: At 3 months Yes (51%); Grp2: At 3 months Yes (72%)	No control group	Grp1: At 3 months No (17.36); Grp2: At 3 months Yes (30.08)	No control group	Grp1: At 3 months in 0.04%; Grp2: At 3 months in 24%	No control group
---------------------------	----	--	------------------	---	------------------	--	------------------

1. Pain reduction efficacy:

- Yes – efficacious: a group mean reduction in pain score of 50% between baseline and follow up
- No – not efficacious, <50% group mean reduction in pain
- ? - inconclusive evidence for pain reduction or not stated in research

2. Shoulder function efficacy:

- Yes – Constant and Murley mean group score point change >25 points
- No – Constant and Murley mean group score point change <25 points

3. Calcific lesion change – Percentage of participants with radiographically verified resorption of calcific lesion.
